```
chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. Expressed from a vector or enzymatically cynthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The TNF siNAs have antibacterial, immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic and antirheumatic, antiarthritic, anti-HIV, antipsoriatic and autoimmune diseases. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human TNF mRNA transcript.

The sinhs may or may not comprise ribonucleotides ar may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assemble from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinclude short interfering RNA (sirNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shrNA). The sinhs can be unmodified or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New short interfering nucleic acid, useful e.g. fo diagnosis of septic shock or rheumatoid arthritis, expression of the tumor necrosis factor gene.
                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human tumour necrosis factor (TNF) genu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chemically synthesised, expressed from a vector or enzymatically continued by synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The TNF siNAs have antibacterial, immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic and antinflammatory activities. They may be used for treating septic shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and autoimmune diseases. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human TNF mRNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    downregulate expression of the human tumour necrosis factor (TNF) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human TNF sinA oligonucleotide SEQ ID NO:424.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADG35072 standard; RNA; 23

chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in converted to the invention also relates to kits for the invitro or in the five delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The TNF siNAs have antibacterial, immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic and antirheumatic, antiarthritic, anti-HIV, antipsoriatic and antirheumatic activities. They may be used for treating septic shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and autoimmune diseases. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                                           RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise ribonucleotides and antisense regions, or alternatively are assembled from a sense and coligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or anymentically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid, useful e.g. for diagnosis of septic shock or rheumatoid arthritis, expression of the tumor necrosis factor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human tumour necrosis factor (TNF) gene
                                                    TNF transcript target sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary disease such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA target DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a double-stranded short interfering nucleic acid (siNA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded sNA comprises about 21 nucleotides. The siNA of the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian

                                                                                                                                                                                                                                       The invention provides novel human 14171 protein kinase polypeptides and polynucleotides. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of a 14171 protein kinase such as cancer, immunological disorder, inflammation, heart failure, hypertension, atrial fibrillation, viral disorder and apoptotic disorder. The invention can also be used in chromosme mapping, tissue typing, predictive medicine, forensic biology and prognostic assays. The present sequence is small interfering RNA-DNA hybrid used to modulate the expression of human 14171 protein kinase. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; 14171 protein kinase; cancer; immunological disorder; inflammation; heart failure; hypertension; atrial fibrillation; viral disorder; apoptotic disorder; chromosome mapping; tissue typing; predictive medicine; forensic biology; DNA-RNA hybrid; ss.

                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a pharmaceutical composition comprising a PRL-1 CC homologous protein or/and its functional fragment, a nucleic acid composure protein and/or a modulator/effector of the nucleic composition is useful for the manufacture of an agent for detecting cor/and verifying, for the treatment, alleviation and/or prevention of composition is useful for the manufacture of an agent for detecting crowledge or/and verifying, for the treatment, alleviation and/or prevention of cor/and verifying, for the treatment, including metabolic syndrome, obesity cor/and diabetes, as well as related disorders such as eating disorder, cor/and diabetes, as well as related disorders such as eating disorder, cor/and diabetes, as well as related disorders such as eating disorder, cor/and diabetes, oscenarthritis, gallstones, or liver fibrosis, in cells, cor/and metabolic syndrome for coll masses, organs and/or subjects in vivo or in vitro. The nucleic acid conclude and polypeptide are useful for the manufacture of a medicament controlling the function of a gene or/and metabolic syndrome for controlling the function of a span-or/and metabolic syndrome for controlling the function of a pRL-1 homologous polypeptide, for controlling substances capable of interacting with a PRL-1 homologous polypeptide, for collentifying substances capable of interacting with a PRL-1 homologous conversion and for the production of a non-human transgenic animal conversion of a medication of a non-human transgenic animal conversion of a medication of the mouse protein tyrosine phosphatase type IVA member 3 i.e. Prl-3 gene for gene expression analysis.
                                                                                                                                                                                                                                                                Query Match

The invention relates to a kit for diagnosing and treating T-cell CC associated diseases which comprises a panel of nucleic acid primers gpecifically priming and allowing amplification of each Vbeta gene, CC vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant crejection and diagnosing and treating T-cell associated diseases, including autoimmune diseases, degenerative nervous system diseases, complete compl

                                 cc including autoimmune diseases, degenerative nervous system diseases, cc graft versus host disease, hypersensitivity diseases, infectious diseases cand neoplastic diseases. Autoimmune diseases include Addison's disease, cc and neoplastic diseases. Autoimmune diseases include Madison's disease, cc atrophic gastritis. Degenerative nervous system diseases include multiple cs clerosis and Alzheimer's disease. Hypersensitivity diseases include Type II hypersensitivities such as contact with allergens that lead to compare the compared to the state of the such as contact with allergens that lead to compared the compared to the such as those present in Cc Goodpasture's syndrome and Type II hypersensitivities such as those caused by ciruses such as HIV, fungal infections such as those caused by caused by viruses such as HIV, fungal infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus Candida, parasitic infections such as those caused by che yeast genus caused by che yeast genu
                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each vbeta gene, vbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; decodpasture's syndrome; allergy; type II hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; leprosy; infections disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemmia; lymphoma; cancer; brain cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-MAR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (HOOD/)

                                                                                                                                                                                                                                                                                                                                                                                                                           The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the HER CC promoter duplex between positions -65 to -380 which contains a purine-rich region concentrated on one chain of the duplex. The oligomer, and CC characterised by specific DNA duplex targets, e.g. cytomegalovirus; HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The Ct without subjecting the test specimen to harsh conditions. The oligomer CC may contain an inverted polarity region formed from an o-xyloso dimer CC synthon. The linking gp. is o-xyloso (nucleotides have the 3 positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modification may render the oligomer stable to nuclease cativity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on CC 25-MAR-2003 to correct PN field.)

These sequences could be used as probes to detect the presence of a particular double stranded (ds) nucleotide sequence. They can also be used to prevent the expression or function of a selected ds sequence. They can be used in the development of antibacterial, anticancer and antiviral agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 16 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligomers comprising purine base analogues - used to identify or prevent expression or function of nucleic acid by triple helix formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Target; T7; expression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAQ38289-91 were used to form triple helices with a target T7 Psoralen-derivatised MP-oligomer (see also AAQ38288). These sequences could be used as probes to detect the presence of a particular double stranded (ds) nucleotide sequence. They can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligomers comprising purine base analogues - used to identify or prevent expression or function of nucleic acid by triple helix formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Triple helix forming oliomer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-MAR-2003

                                                                                                                                                                                                                                                                                                                          Three sets of all-purine methylphosphonate oligonucleosides ("MP oligomers") and complementary ribboligonucleosides ("RNA oligomers") were examined for their ability to form triple helix complexes. (Set 1:G2100 and R39; Set 2:G2101 and R289; Set 3:G2106 and R84 - see AAQ68229-34). It was shown that all-purine MP oligomers contg. a 50:50 mixt. of adenines and guanines are capable of forming 2:1 MP:RNA triple stranded complexes with their complementary RNA oligomers. Three sets of all-purine methylphosphonate oligonucleosides ("MP oligomers") and complementary ribooligonucleosides ("NN oligomers") examined for their ability to form triple helix complexes. (Set 1:G2: and R39; Set 2:G2101 and R289; Set 3:G2106 and R84 - see AAQ68229-34)
                                                                         Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of a triple helistructure using 2 oligomers which block translation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Triple helix formation with 2:1 MP:RNA oligomers was thermal denaturation methods. Exemplary triple helix are given in AAQ68242-52. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of a triple helistructure using 2 oligomers which block translation.
                                                                                                                                                                                                                                                                                 Synthetic

                        Oligomers ANV54880-83 were purified using the method of the invention. The specification describes a new process is for separating an oligomer with a selected nucleoside sequence from impurity oligomers with different sequences. It comprises normal phase column chromatography on a column with polyhydroxyethyl aspartamide, silica or hydrophobic silica as the support, where the hydrophobic silica has its silica component modified with an uncharged hydroxylated hydrophillic moiety other than cyclodextrin, including separation conditions so that the oligomer has a different retention time on the column than the impure one, provided that the desired oligomer differs from the impurity in nucleoside sequence by other than a thymine or uracil base. The method is used for the purification of desired oligomers from impurity oligomers based on properties that are incorporated into the desired oligomers during their manufacture. Purified oligomers can be used as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligomer purification using normal phase column chromatography separates the desired oligomers from impurity ones, based on sp characteristics of the desired oligomers introduced during their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                was shown that all-purine MP oligomers contg. a 50:50 mixt. of and guanines are capable of forming 2:1 MP:RNA triple stranded with their complementary RNA oligomers. (Updated on 25-MAR-2003 correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 9;

                                                                                                                                                                                                                                                                   The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers. Rp chirally enriched synthetic oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AXX91054-75 represent oligomers chemically synthesised using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligomers made using chirally pure nucleoside dimers, trimers, tetramers with enhanced binding affinities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 16

                                                                                                                                                                                                                                                                                                                                                                                                                           target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidy; phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers. Rp chirally enriched the providing chirally enriched synthetic oligomers. Rp chirally enriched the providing chirally enriched synthetic oligomers. Rp chirally enriched the providing chirally enriched synthetic oligomers. Rp chirally enriched the providing chirally enriched synthetic oligomers. Rp chirally enriched the providing chirally enriched synthetic oligomers.
                                                                                                                                                                                                                                                                                                                                                               synthetic oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AAX91054-75 represent oligomers chemically synthesised using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligomers made using chirally pure nucleoside dimers, tetramers with enhanced binding affinities.

                                                                                                                                                                                                                                                                문
                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing varieties and testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and or stability of a cultivar. The present
                                                                                                                                                                                                                                                                                                                                 Query Match

The electrodes are used for concentration of additional biomolecules (especially RNA or DNA), having affinity for (I), from a sample solution, and for quantitative electrochemical detection of biomolecules. The electrodes are produced simply and inexpensively, with a high loading of (I) (and the loading can be adjusted by selection of pH, temperature, or treatment time). The electrical resistance of the electrode surface is reduced, i.e. conductivity is improved. This sequence represents a nucleic acid fragment used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 16 BP; 8 A; 0 C; 8 G; 0 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    target polynucleotides, where one target polynucleotide comprises at least one target sequence that is shared with one or more other polynucleotides. A predefined combination of promiscuous probes is capable of hybridising to target sequences of at least one target polynucleotide, wherein said predefined combination of probes provide specificity of detection of that target polynucleotide. The probes of the invention are useful for detecting a number of different target polynucleotides using a programmable digital computer or for detecting an unknown or uncharacterised number of a polynucleotide family. The present sequence is potyvirus polymerase B motif encoding DNA used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         methods for detecting several different target polynucleotides. The set comprises a collection of different promiscuous probes each of which is capable of hybridising to a target sequence shared between at least two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Set of oligonucleotide probes for detecting different target polynucleotides, comprises a collection of different promiscuous each of which hybridizes to a target sequence shared between two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;

                                                         a membrane which comprises using a receptor that uses salt bridgin, aromatic stacking, H bonding and chelation to recognise the nucleic acid deriv. AAQ56305, AAQ58577-86 are nucleic acid derivs used in the examples. Nucleotides 1-16 of AAQ58577 are ribonucleotides and nucleotide 17 is a deoxyribonucleotide. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       microorganism in a sample by detecting its nucleotide sequence from amongst homologous sequences. The method can be used to detect microorganisms and polymorphisms, and to diagnosis genetic diseases including cancer. The present sequence is a consensus primer used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic uncleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers, Rp chirally enriched synthetic oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AAX91054-75 represent oligomers chemically synthesised using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligomers made using chirally pure nucleoside tetramers with enhanced binding affinities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligomer prepared using 2'-O Methyl MP(Rp)/2'-O Methyl MP dimer

                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers, Rp chirally enriched synthetic oligomers, Rp chirally enriched synthetic oligomers with racemic all methylphosphonate internucleosidyl linkages.

                                                                                                                                                 ş
                                                                   RESULT 1241
                                                                                                                                                                                                                                                                                                   The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 CC l can be used in gene therapy and vaccine production. The hGDMLP-1 CC nucleic acids can be used as probes to detect, characterise and quantify CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 CC protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 CC used as immunogens to raise antibodies that specific biomolecule cond/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as thardards in assays used to determine the concentration capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in partients having specific deficiency in hGDMLP-1 compactually production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 most deficiency in hGDMLP-1 conduction, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 in particular heart conditions skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed capture with the expression of hGDMLP-1 in particular heart of the present invention.                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as the protein and the protein of the pro
therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gu Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-JAN-2001;

protein 1 (hGDMLP-1). The protein and polymic-leotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 proteins, and in vaccines or for replacement therapy. The polymorphopolation, and in vaccines or for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               30-JAN-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    á
                            given in the specification, a sequence containing at least 15 consecutive concloses from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that conditions, or the complement conditions of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, collseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases. The polypeptides can also be used to generate antibodies, and for patient samples is useful for diagnosis and/or prognosis of these care and seven to the sequence of the sequence of the sequence of these care and sequence and sequence of the sequence of these care and sequence of the sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; bladder cancer; paracreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; floropuracil carboplatin; edatrexate; gemecitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn; s disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss
                    The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.
                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecules which down regulates expression a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chips. The nucleic acid sequences of the invention can be therapy. This polynucleotide sequence represents a tumour related human fukutin oligonucleotide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cc cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or CC multidrug resistant cancer. The method involves use of other drug CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, CC cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, CC cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic CC acid molecules are also useful for treating inflammatory disease such as Cr heumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft CC rejection, gene therapy applications, ischaemia/reperfusion injury CC (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or CC infection. This sequence represents the substrate of a novel enzymatic consistence of a novel enzymatic co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                        The invention relates to the isolation of 6327 nucleotide sequences, of fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SSSS
The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (hat down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), I kappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ន្តន្តន
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 1248
The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (For an neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), I RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating; cerebrovascular accident, central rervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, I ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohn's disease (diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic carifts and mutations within diseased cells or to detect the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

29-MAY-2001;
28-AUG-2001;
The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, nultiple sclerosis, transplant/graft rejection, schaemia/reperfusion injury, glomerulomephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB Kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; Human IKK-gamma.
                                                                                                                                                                                                                                                                 Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gamma
